Late Breaker: COVID-19 cases and hospitalizations continue to decline throughout the state. We are continuing to see numerous children with MIS-C with over 30 children diagnosed and treated for MIS-C in the month of December at CHCO. Remember to keep MIS-C on the differential diagnosis of children presenting with high fevers, high levels of inflammation (CRP usually > 10 mg/dL), and multisystem involvement including prominent gastrointestinal symptoms (abdominal pain, vomiting, and/or diarrhea), rash, red eyes or lips (similar to Kawasaki Disease), and/or cardiac involvement. MIS-C usually occurs 2-6 weeks after a SARS-CoV-2 infection which may be symptomatic or asymptomatic. Please refer to our MIS-C clinical pathway for more information regarding diagnosis and treatment: https://childrenscolorado.sharepoint.com/sites/pathways/Pages/default.aspx.
