Late Breaker: The number of SARS-CoV-2 infections and hospitalizations continues to decline. While this is encouraging news, the overall statewide percent positivity (~15%) is still higher than the peaks of the previous alpha and delta waves. A recent study demonstrated that the Pfizer COVID-19 vaccine was 94% effective against hospitalization and 98% effective against ICU admission in adolescents between 12 and 18 years old (https://www.nejm.org/doi/full/10.1056/NEJMoa2117995#). Additionally, the CDC released new data demonstrating that consistent use of a face mask or respirator in indoor public settings lowered the odds of a positive SARS-CoV-2 test by 56% or more depending upon type of mask used.
