Late Breaker: Influenza cases continue to rise here in Colorado and throughout the United States. The predominant circulating strain is influenza A(H3N2). CDC reports that the number of hospital admissions due to influenza has increased each week for the past 8 weeks, but the cumulative hospital rate remains below rates seen at this time during the four seasons preceding the COVID-19 pandemic. Although it is April, respiratory season is still here. In addition, we are seeing a high number of children testing positive for enteric viruses, particularly norovirus. The CDC is also reporting a nationwide increase in norovirus outbreaks.
