Late Breaker: Respiratory season is officially here, and we are seeing a significant number of children testing positive for RSV. Additionally, we are again seeing a rise in cases of COVID-19 here in Colorado and throughout the United States. Almost all (>95%) of COVID-19 cases in Colorado are now due to the delta variant. Recent data suggests that although vaccine efficacy is excellent against hospitalization and severe disease due to the delta variant there is decreased efficacy against infection and transmission. Because of these findings, the CDC now encourages all people, regardless of vaccine status, to wear masks or face coverings in indoor public spaces. This recommendation includes children in school settings.
