Late Breaker: In addition to the high number of hospitalizations due to respiratory viruses this year, we have also seen an increase in serious bacterial infections. We have seen a large number of invasive infections, primarily severe pneumonia, due to *Streptococcus pneumoniae*. In addition, there has also been an increase in the number of invasive group A streptococcal (GAS) infections. This serves as a critical reminder to encourage everyone to be up to date on their pneumococcal vaccines in addition to COVID-19, influenza, and varicella vaccinations as those infections are known to be predisposing risk factors for the development of invasive GAS infections.
