Late Breaker: Colorado continues to see a rise in avian influenza H5N1 cases. To date, there have been 62 livestock herds in Colorado that have been affected. Additionally, there have been 10 reported human cases due to spread from dairy cows or poultry. No human-to-human transmission has been documented. Providers should consider avian influenza and test for influenza in anyone presenting with respiratory symptoms or conjunctivitis who has recent exposure to dairy cows, poultry, wild birds, or cats. Additionally, everyone should be advised not to drink unpasteurized milk. More information can be found at: https://cdphe.colorado.gov/animal-related-diseases/hpai-h5n1.
