Late Breaker: We are starting to see the usual late summer/early fall rise in rhinovirus/enterovirus infections which typically correlates with return to school. We have also started to see a slight upward trend in the number of COVID-19 infections. This is in alignment with what CDPHE is reporting for the entire state (https://covid19.colorado.gov/) with noticeable increases in 18-25 year old’s which likely relates to Labor Day activities and opening of colleges. Influenza season is quickly approaching and now is the time to begin vaccinating! With ongoing circulation of SARS-CoV-2 and potential for a second wave this winter high rates of influenza vaccination are critically important this year.
