Late Breaker: Respiratory season is still here and has not yet peaked as cases of RSV and influenza remain high and continue to rise. In addition, we are seeing a large increase in enteric viruses, particularly norovirus. The most common symptoms of norovirus include diarrhea, vomiting, nausea, and abdominal pain and some patients will also present with fever, headaches, and myalgias. The incubation period is 12 to 48 hours, most people have symptoms for 1 to 3 days, and you can still spread the virus for several days after recovering (up to 2 weeks). Noroviruses are highly contagious with an infectious dose estimated at only 10-100 viral particles. Transmission occurs primarily via the fecal-oral route by consumption of contaminated food or water, direct spread from person to person, or by touching contaminated surfaces. Wash your hands!
