Late Breaker: The recent CDC HAN advises clinicians to provide guidance to international travelers for measles prevention and to be watchful for cases of measles [Health Alert Network (HAN) - 00493 | Guidance on Measles during the Summer Travel Season (cdc.gov)]. This is particularly important due to the global decline in measles vaccination during the COVID-19 pandemic. In the US this year there have already been 16 confirmed cases of measles. All patients 6 month of age and older, without evidence of immunity, should receive the MMR vaccine prior to international travel. Measles should be considered in the differential diagnosis of anyone with fever and a generalized maculopapular rash with cough, coryza, and conjunctivitis, especially in patients with a history of recent international travel. Countries with current measles outbreaks include India, Somalia, and Yemen.
