Late Breaker: Just in time for the holidays, respiratory season has arrived! We are seeing increased cases of influenza and RSV. Interestingly (and somewhat unusually) we are seeing more influenza B than influenza A. This is important to keep in mind as influenza B can sometimes present clinically differently than influenza A. The CDC reports that nationwide the number of influenza cases has been elevated over the past few weeks and continues to increase with the influenza B/Victoria virus as the predominate circulating virus which is contained in the trivalent and quadrivalent influenza vaccines. Additionally, there has been 6 reported pediatric deaths so far this season attributable to influenza. It is not too late—continue to vaccinate!
