Late Breaker: As of September 19, there has been 1,241 cases of measles in the US. This is the greatest number of cases reported in the US since 1992. The CDC recently published a report on interventions used during the ongoing outbreak in New York to reduce potential measles exposures in outpatient health care facilities. Interventions included examining patient outdoors (in their cars), having patients use separate entrances removed from the general patient population, evaluating patients after normal business hours, and conducting home visits.
