Late Breaker: Last week the CDC recommended that everyone 6 months and older get a COVID-19 booster vaccine with the new vaccine formulation. The new vaccine will replace all previous vaccines (younger children who have not received a primary series should complete the series with the new vaccine) and is a monovalent vaccine targeting the XBB lineage of the Omicron variant. The updated vaccines should work well against all currently circulating strains of SARS-CoV-2 and provide increased protection against severe disease, including hospitalizations and death.
