ACETAMINOPHEN (APAP) TOXICITY

ALGORITHM 1. ACUTE Acetaminophen (APAP) Toxicity

ACUTE Acetaminophen (APAP) ingestion:
- All the ingestion taken within an 8 hour timeframe
- Presenting less than 24 hours after a known time of ingestion

NONACUTE Acetaminophen (APAP) ingestion:
- Inaccurate timeline (poor history)
- Unknown timeline
- Repeated Supratherapeutic Ingestion (all the ingestion occurs in greater than an 8 hour timeframe)
- Presenting greater than 24 hours after acute ingestion

ACUTE Acetaminophen (APAP) ingestion:
• Obtain APAP concentration 4 hours from the earliest time of ingestion
• Complete Metabolic Panel (CMP)
• Obtain a salicylate concentration
• Any other relevant labs

Plot APAP concentration on Matthew Rumack Nomogram (4-24 hours past time of ingestion) (Page 8)

Above Treatment Line?

Normal Transaminases (AST/ALT)?

Inclusion Criteria:
- Any patient with concern for acetaminophen toxicity

Exclusion Criteria:
- Ingestion of acetaminophen with co-ingestants (i.e. cough and cold preparations) (may contain dextromethorphan, diphenhydramine), sleep/night preparations (PM) (may contain diphenhydramine, chlorpheniramine), opioid combination products
- Severe ingestions (APAP blood concentrations greater than 100 mcg/ml)

Can medically clear from APAP toxicity

Initiate N-Acetylcysteine (NAC)
• If liver function tests abnormal, obtain Prothrombin Time/International Normalized Ratio (PT/INR)

INR greater than 2 OR greater than 1.5 with encephalopathy?

Consult toxicology through Rocky Mountain Poison & Drug Safety (RMPDS) for further recommendations 1-800-222-1222

Consult Liver Service
• Consider social work consultation if there are concerns for maltreatment or neglect resulting in APAP ingestion or toxicity.

Matthew Rumack Nomogram
ALGORITHM 2. NONACUTE Acetaminophen (APAP) Toxicity

NONACUTE Acetaminophen (APAP) ingestion:
- Inaccurate timeline (poor history)
- Unknown timeline
- Repeated Supratherapeutic Ingestion (all the ingestion occurs in greater than an 8 hour timeframe)
- Presenting greater than 24 hours after acute ingestion

APAP concentration greater than 20 mcg/ml?
- Obtain APAP concentration immediately
- Complete Metabolic Panel (CMP)
- Any other relevant labs

Normal Transaminases (AST/ALT)?
- Initiate N-Acetylcysteine (NAC)
- If liver function tests abnormal, obtain Prothrombin Time/International Normalized Ratio (PT/INR)

INR greater than 2 OR greater than 1.5 with encephalopathy?
- Consult toxicology through Rocky Mountain Poison & Drug Safety (RMPDS) for further recommendations 1-800-222-1222

INR greater than 2 OR greater than 1.5 with encephalopathy?
- Consult toxicology through Rocky Mountain Poison & Drug Safety (RMPDS) for further recommendations 1-800-222-1222
- Admit to hospital service

Inclusion Criteria:
- Any patient with concern for acetaminophen toxicity

Exclusion Criteria:
- Ingestion of acetaminophen with co-ingestants (i.e. cough and cold preparations) (may contain dextromethorphan, diphenhydramine), sleep/night preparations (PM) (may contain diphenhydramine, chlorpheniramine), opioid combination products
- Severe ingestions (APAP blood concentrations greater than 300 mcg/ml)

ACUTE Acetaminophen (APAP) ingestion:
- All the ingestion taken within an 8 hour timeframe
- Presenting less than 24 hours after a known time of ingestion

All self-harm ingestion attempts will need psychiatric evaluation
Consider social work consultation if there are concerns for maltreatment or neglect resulting in APAP ingestion or toxicity.

Inclusion Criteria:
- Any patient with concern for acetaminophen toxicity

Exclusion Criteria:
- Ingestion of acetaminophen with co-ingestants (i.e. cough and cold preparations) (may contain dextromethorphan, diphenhydramine), sleep/night preparations (PM) (may contain diphenhydramine, chlorpheniramine), opioid combination products
- Severe ingestions (APAP blood concentrations greater than 300 mcg/ml)

Inclusion Criteria:
- Any patient with concern for acetaminophen toxicity

Exclusion Criteria:
- Ingestion of acetaminophen with co-ingestants (i.e. cough and cold preparations) (may contain dextromethorphan, diphenhydramine), sleep/night preparations (PM) (may contain diphenhydramine, chlorpheniramine), opioid combination products
- Severe ingestions (APAP blood concentrations greater than 300 mcg/ml)

Inclusion Criteria:
- Any patient with concern for acetaminophen toxicity

Exclusion Criteria:
- Ingestion of acetaminophen with co-ingestants (i.e. cough and cold preparations) (may contain dextromethorphan, diphenhydramine), sleep/night preparations (PM) (may contain diphenhydramine, chlorpheniramine), opioid combination products
- Severe ingestions (APAP blood concentrations greater than 300 mcg/ml)
TARGET POPULATION

Inclusion Criteria
Any patient with concern for acetaminophen toxicity.

- Acute supratherapeutic acetaminophen ingestion
- Unknown time of a supratherapeutic acetaminophen ingestion
- Repeated supratherapeutic acetaminophen ingestion

Exclusion Criteria

- Ingestion of acetaminophen with co-ingestants (ie cough and cold preparations (may contain dextromethorphan, diphenhydramine), PM preparations (may contain diphenhydramine, chlorpheniramine), opioid combination products)
- Severe ingestions (APAP blood concentrations greater than 400 mcg/ml)

BACKGROUND | DEFINITIONS

Acetaminophen (APAP) is an over-the-counter analgesic and antipyretic that is commonly used in all ages. Therapeutic mechanism of action is via inhibition of the formation of prostaglandins. In overdose or supratherapeutic settings, it can lead to hepatotoxicity. In extreme circumstances, overdose can lead to liver failure, metabolic acidosis, cerebral edema and death. APAP ingestions are one of the most common reported unintentional and intentional ingestions. In the 2017 National Poison Data System annual review, there were almost 110,000 human exposures to APAP single ingredient and combination products. There were 142 deaths attributed to APAP combination exposures, and 140 acetaminophen alone exposures. In pediatrics, APAP ingestions are one of the most common presenting toxicological complaints in the emergency room and is a leading toxicological diagnosis requiring admission to both the inpatient ward and ICU.

In normal metabolism, APAP is renally eliminated unchanged (5%) or metabolized via hepatic glucuronidation (40-65%) and sulfation (20-45%). In supratherapeutic ingestion, these metabolic pathways become saturated and metabolism occurs via CYP 2E1 to NAPQI, which can lead to cellular toxicity (specifically hepatotoxicity). NAPQI is normally conjugated to glutathione to form nontoxic APAP conjugates which are eliminated in the urine. However, it is overproduced in overdose settings, leading to hepatotoxicity.
DEFINITIONS

- **ACUTE ingestion:** all of the ingestion of APAP taken within an 8-hour timeframe, and presenting less than 24 hours after initial time of ingestion
- **NON-ACUTE ingestion:**
  - Inaccurate timeline (poor history)
  - Unknown timeline
  - Repeated Supratherapeutic Ingestion (RSTI): ingestion occurs in greater than an 8 hour timeframe
  - Presenting greater than 24 hours after ingestion

CLINICAL MANAGEMENT

Obtain thorough history and perform physical exam.

**History:**
- Inquire about past medical history (hospitalizations, recent illness, psychiatric history including past suicidal ideation or attempts)
- Take a medication history. This includes regular medications, or recently taken medications. Potential other medications that the patient could have access to is also important in ruling out other ingestions.
- Obtain details of events including: timeline of events (when ingestion occurred), the maximum amount suspected (tablet strength, size of bottle, estimate of number of tabs remaining), and subsequent timeline of events (any therapies, interventions, symptoms that have developed prior to arrival).

**Clinical Symptoms of APAP toxicity:**

- Most patients will develop nausea/vomiting after supratherapeutic ingestion of APAP.
- Some patients may be asymptomatic.
- In a large overdose, somnolence or CNS depression may develop.
- APAP is common in combination preparations. Thus, initial symptoms may be due to co-ingestants such as antitussive agents (dextromethorphan), antihistamines (diphenhydramine, chlorpheniramine), and opioids (codeine, oxycodone, hydrocodone). These co-ingestants, specifically antihistamines, can lead to irregular kinetics, erratic absorption, and unpredictable toxicity.

**Clinical Progression of APAP toxicity:**

- Nausea/vomiting can last 24-36 hours after ingestion. In large overdose, metabolic acidosis and cardiovascular collapse can occur within hours of ingestion.
- Without treatment, liver transaminitis will begin approximately 20-24 hours after time of ingestion (as early as 12 hours in the most severe of ingestions). The aspartate aminotransferase (AST) will be the first to rise, followed by alanine aminotransferase (ALT). Level of transaminitis can range from 2-3 times normal, to greater than 10-20,000 IU/L in severe toxicity. Maximum liver toxicity occurs between 72-96 hours after ingestion. Transaminitis does not universally lead to coagulopathy or liver dysfunction.
- Liver dysfunction (if occurs) can occur approximately 2-3 days after ingestion. Signs will include coagulopathy, and encephalopathy
- Acute kidney injury (if occurs) can occur 2-5 days after ingestion, often peaking at 7 days after ingestion.
- Without treatment, fatalities can occur 3-5 days after acute overdose.
• In recovery phase after ingestion, the AST typically will decline prior to ALT, followed by improvements in liver and kidney function.

**Prognosis of APAP toxicity:**

• Ingestions that present and receive N-Acetylcysteine (NAC) within 8-10 hours from time of ingestion universally do well and expect a full recovery.

• Even those who present after the 8-10 hour time-frame and receive NAC typically do well.

• Patients who present after the setting of a chronic repeated supratherapeutic ingestion (RSTI), late presenting acute ingestion, and/or already with signs of liver dysfunction, have a guarded and potentially poor prognosis.

• Lactate greater than 3.0 mmol/l after fluid resuscitation or 3.5 mmol/l at 55 hours after ingestion has been an indicator of increased mortality without transplantation.

• The most commonly used indicator for the need for immediate transplantation in adults with APAP toxicity is the King’s College Criteria (KCC). Survival rate of adult patients who meet KCC and do not receive organ transplant is less than 20%. KCC includes:
  - pH greater than 7.30 after adequate fluid resuscitation
  - OR Combination of:
    - Creatinine (Cr) greater than 3.4 mg/ml
    - Prothrombin (PT) greater than 100 s (INR greater than 6.5)
    - Grade III or IV encephalopathy

• Other scores used to assess adult patients for need for transplantation after APAP ingestion include APACHE II score greater than 15, APACHE III score greater than 60, or combination of hypoglycemia, coagulopathy and lactic acidosis.

**Differential Diagnosis:**

• Although toxicity is quite different, other over-the-counter analgesics are often mistaken for each other, including aspirin, and NSAID’s.

• Other etiologies for hepatotoxicity and liver failure, both toxicological and non-toxicological in nature, should be explored.

**Monitoring:**

• Continuous cardiac/pulse oximetry monitoring is recommended for unstable and critically ill patients.

**LABORATORY STUDIES | IMAGING**

• For ACUTE ingestions: APAP concentration and complete metabolic panel should be obtained at 4 hours after the earliest known time of ingestion (or upon presentation if after 4 hours). This concentration can be plotted on the Matthew-Rumack Nomogram to determine treatment plan.

• For NON-ACUTE ingestions: APAP concentration and complete metabolic panel should be obtained upon presentation. The Matthew-Rumack Nomogram is not applicable.

• Consider coagulation panel if transaminitis is noted.

• Obtain a venous blood gas for patients with metabolic acidosis noted on their electrolytes, altered mental status, or liver synthetic dysfunction.

• A salicylate concentration should be obtained to rule out erroneous reporting of analgesic ingested.

• Other studies include labs or electrocardiogram to investigate co-ingestants as clinically indicated.
THERAPEUTICS

Routinely Indicated: N-Acetylcysteine (NAC)

- There are no changes in morbidity or mortality between the 2 routes of administration of NAC. IV is more often used due to the ease of use, shorter duration/course of treatment, and difficulties with PO administration with significant nausea/vomiting.
- There may be circumstances in severe overdose when the rate and/or amount of NAC is increased. This should be done in consultation with the Medical Toxicology Service.

Intravenous (IV) N-Acetylcysteine (NAC)

- 2-Bag regimen
  - FIRST dose: 200 mg/kg/dose (max: 20 grams) infused over 4 hours
  - SECOND dose: 100 mg/kg/dose (max: 10 grams) infused over 16 hours
  - IF NEEDED, continuation of treatment beyond the second dose: 100 mg/kg/dose (max: 10 grams) infused over 16 hours. Begin subsequent bags immediately after prior bag finishes.
  - IF patient is started on a 3-bag regimen at an outside facility (150mg/kg loading dose over 1 hour followed by 50mg/kg over 4 hours) – may switch patient over to 16 hour ‘second’ dose on arrival
- Common adverse events:
  - Non-allergic anaphylactic reactions (NAARs) – rash, hives, flushing, throat tightness, angioedema
  - Gastrointestinal – dyspepsia, nausea, vomiting
  - Can administer diphenhydramine, decrease the rate of IV administration, or transition to PO formulation with significant adverse events.
  - Can also cause a slight bump in INR, though should still be greater than 2. An INR less than 2 should not be attributed to IV NAC.

Oral (PO) N-Acetylcysteine (NAC)

- N-Acetylcysteine 20% (200 mg/ml): 
  
  *There is no data for use of the OTC supplement tablets for acetaminophen poisoning. Dosing below is based on effervescent tablet (Cetylev) or a solution for oral administration that is prepared from the solution for oral inhalation:*
  
  o 72-hour regimen: Consists of 18 doses; total dose delivered: 1,330 mg/kg
    - Loading dose: 140 mg/kg; maximum dose: 15 g/dose
    - Maintenance dose: 70 mg/kg every 4 hours for 17 doses; maximum dose: 7.5 g/dose
      - Repeat dose if emesis occurs within 1 hour of administration
      - Note: 72 hour regimen may be shortened, but this should be done in consultation with the medical toxicology service.
- Common adverse events (or difficulties with compliance):
  - Similar to IV, although less NAARs and more GI related ADEs
  - Amount of doses and volume may be hard for patient to tolerate
  - Has sulfur (rotten-egg) smell/taste -- may be mixed in juices, soda, or other vehicles to aid in palatability
Recommended in some patients:

Activated Charcoal

- For acute ingestions who present less than 2 hours post ingestion with normal mentation, consider dose of activated charcoal (0.5-1 g/kg), ONLY if the patient can voluntarily self-administer.

Intravenous Fluids

- Patients with severe toxicity and illness, nausea/vomiting, or inability to have oral intake should receive IVF resuscitation and maintenance fluids with appropriate dextrose and electrolytes.

Extracorporeal Removal

- In severe overdose, where toxicity has led to CNS symptoms, metabolic acidosis (which is typically APAP blood concentrations greater than 800 mcg/ml), hemodialysis or continuous renal replacement therapy has been used to correct the metabolic derangements in addition to extracting APAP. This modality is used sparingly and should be used in consultation with Medical Toxicology Service.

Not Routinely Indicated:

Gastric Lavage, whole bowel irrigation, or cathartics
Disposition

- Acute ingestion: patients with an APAP above the Matthew-Rumack Nomogram Treatment Line will require course of NAC.

- Unknown or RSTI: patients with a supratherapeutic concentration (APAP greater than 20 mcg/ml) or elevated transaminitis will require course of NAC
ADMISSION to inpatient/observation

- Consult toxicology via the Rocky Mountain Poison and Drug Safety (RMPDS) at 1-800-222-1222
- Patients without significant liver dysfunction (INR greater than 2) can be observed in the ED or admitted to the inpatient hospitalist service for course of NAC

ADMISSION to ICU

- If INR greater than 2 OR INR greater than 1.5 WITH encephalopathy:
  - Other significant risk factors: pH less than 7.3, acute kidney injury (AKI), metabolic acidosis
  - Consult Liver Service who will be primary consultation
  - Consult toxicology via the Rocky Mountain Poison and Drug Safety (RMPDS) at 1-800-222-1222 for further questions or if there are co-ingestants
  - Patients admitted to ICU with involvement of Liver Service, can be transferred to the Liver Inpatient Service once clinically stable

STOPPING CRITERIA FOR NAC

- For an acute APAP ingestion, repeat LFT's and APAP concentration 1-2 hours prior to completing each 16-hour bag or prior to last PO dose.
- For a nonacute APAP toxicity, repeat labs q12 hours (LFT's, APAP concentration, and INR, if applicable).
- Duration of NAC may be shortened per toxicology recommendations.
- Recommended stopping criteria for any APAP toxicity:
  - APAP less than 20 mcg/ml
  - LFT's (AST/ALT) remain normal (if transaminitis never occurred) OR declining and approximately 50% of peak levels
  - Cr less than 2 mg/dl and declining (if applicable)
  - INR less than 2 and declining (if applicable)
  - Clinically well (without encephalopathy)

MEDICAL CLEARANCE

- All self-harm ingestion attempts will need psychiatric evaluation.
- Consider social work consultation if there are concerns for maltreatment or neglect resulting in APAP ingestion or toxicity.
- All discharged patients who have LFT's that have not completely normalized upon medical clearance will need outpatient follow up with repeat LFT's every 1-2 weeks until normalized. If liver tests remain elevated after 1-2 months, they will need follow up with Liver Team as outpatient.

PARENT | CAREGIVER EDUCATION

- Most patients who receive NAC within 8-10 hours within the time of ingestion will fully recover
- Once recovered, long-term liver injury or dysfunction is not expected
- Poison prevention counseling
- Mental health resources

**REVIEW | REVISION SCHEDULE**

Scheduled for full review on August 1, 2023
Discrimination Is Against the Law. Children's Hospital Colorado complies with applicable Federal civil rights laws and does not discriminate on the basis of race, color, national origin, age, disability, or sex. Children's Hospital Colorado does not exclude people or treat them differently because of race, color, national origin, age, disability, or sex.

Children's Hospital Colorado provides free aids and services to people with disabilities to communicate effectively with us, such as: Qualified sign language interpreters, written information in other formats (large print, audio, accessible electronic formats, other formats). Children's Hospital Colorado provides free language services to people whose primary language is not English, such as: Qualified interpreters, information written in other languages.

If you need these services, contact the Medical Interpreters at 720-777-9800.

If you believe that Children's Hospital Colorado has failed to provide these services or discriminated in another way on the basis of race, color, national origin, age, disability, or sex, you can file a grievance with: Corporate Compliance Officer, 13123 E 10th Avenue, B450, Aurora, Colorado 80045, Phone: 720.777.1234, Fax: 720.777.7257, corporate.compliance@childrenscololorado.org. You can file a grievance in person or by mail, fax, or email. If you need help filing a grievance, the Corporate Compliance Officer is available to help you.

You can also file a civil rights complaint with the U.S. Department of Health and Human Services, Office for Civil Rights Complaint Portal, available at corporal.hhs.gov/orcportal/lobbyist, or by mail or phone at: U.S. Department of Health and Human Services 20 Independence Avenue, SW Room 509F, HH51 Building Washington, D.C. 20201 1-800-368-1019, 800-537-7697 (TDD). Complaint forms are available at www.hhs.gov/ocroffice/file/index.html.

Children's Hospital Colorado complies with applicable Federal civil rights laws and does not discriminate on the basis of race, color, national origin, age, disability, or sex.
